SUMMARY

Full-stack software engineer with 3+ years at General Motors building Java/Spring Boot services, PostgreSQL, and Angular applications, delivering features from stakeholder requirements to production and leaving systems faster, more secure, and easier to deploy. Recent projects extend this to concurrency-safe APIs, idempotent writes, and validated LLM integrations.

EXPERIENCE

Software Engineer Jan 2023 – May 2026

General Motors *Austin, TX*

Developed and maintained internal applications that configure vehicle features for ~300 business users across 40+ vehicle programs, plus one that resolves supplier warranty claims. Worked across three product teams of 3 to 15 developers, gathering requirements directly from business stakeholders and demoing progress to them twice weekly.

- Cut vehicle-catalog load times from ~20s to 2s (truck catalogs from ~2 min to 20s) by using AI-assisted EXPLAIN analysis to pinpoint and optimize an unbounded subquery, removing a daily bottleneck for business users across 1,000+ catalogs.
- Migrated a vehicle-program app from Pivotal Cloud Foundry to on-premises Kubernetes before a year-end deadline carrying a $1M+ penalty, authoring manifests and a deployment pipeline that three other teams reused.
- Independently upgraded a security-flagged vehicle-configuration app from end-of-life Angular 15 and Spring Boot 2.7 to 18 and 3.4, fixing PrimeNG and Spring Security breakage to keep a tool business users relied on secure and supported.
- Built a business-requested sync across Angular, Spring Boot, and PostgreSQL to keep paired vehicle-feature exclusion rules aligned, stopping bad data from reaching downstream systems and ending routine manual fixes.
- Moved regression detection from business users' UAT testing into CI by building the frontend's first Jest and Playwright suite (0% to 50% coverage) and raising JUnit coverage from ~20% to 90% across seven microservices.

PROJECTS

Configuration Rule Engine | cre.rgonz.dev 2026

Java, Spring Boot, Spring AI, Angular, PostgreSQL

- Designed a Spring Boot REST API where Spring AI drafts rules from plain English and a deterministic Java checker blocks contradictions before apply; capped LLM spend with rate limits enforced atomically in PostgreSQL.
- Made concurrent edits and retries safe with row locks, optimistic versioning, and idempotent apply receipts; secured guest sessions with Spring Security, Spring Session JDBC, and CSRF, proven by 48 Testcontainers tests.

PagePulse | pagepulse.rgonz.dev 2026

TypeScript, React, Cloudflare Workers, D1, KV

- Launched a full-stack A/B testing app on Cloudflare Workers, D1, and KV; SQL reporting counts only accounts past their 24-hour window, and an idempotent finalizer saves one immutable result with a confidence interval.
- Hardened signup admission so lost responses recover the committed assignment, D1 enforces capacity when signups race for the last spot, and KV caches settings but never grants admission; a cron job closes runs and purges sessions.

EDUCATION

The University of Texas at San Antonio San Antonio, TX

Bachelor of Science in Computer Science *May 2022*

TECHNICAL SKILLS

Languages: Java, TypeScript, JavaScript, SQL
Frontend: Angular, React, RxJS, NgRx, PrimeNG, Angular Material, AG Grid, Tailwind CSS
Backend & Data: Spring Boot, Spring Security, Spring AI, Spring Data JPA, Hibernate, JDBC, REST APIs, PostgreSQL, D1, Flyway
Cloud & DevOps: Cloudflare Workers, KV, Kubernetes, Azure AKS, Docker, Nginx, GitHub Actions (CI/CD)
Testing & Observability: JUnit 5, Jest, Playwright, Testcontainers, JMeter, Prometheus, Grafana
